## Unbounded Solution

In maximization LPP, if $C_{j}-Z_{j}>0\left(C_{j}-Z_{j}<0\right.$ for a maximization case) for a column not in the basis and all entries in this column are negative, then for determining key row, we have to calculate minimum ratio corresponding to each basic variable having negative or zero value in the denominator. Negative value in the denominator can not be considered, as it would indicate the entry of non-basic variable in the basis with a negative value (an infeasible solution will occur). A zero value in the denominator would result in ratio having a $+\infty$. This implies that the entering variable could be increased indefinitely with any of the current basic variables being removed from the basis. In general, an unbounded solution occurs due to wrong formulation of the problem within the constraint set, and thus needs reformulation.
Example: Solve the following LPP;

$$
\operatorname{Max} Z=3 x_{1}+5 x_{2}
$$

subject to the constraints

$$
\begin{array}{r}
x_{1}-2 x_{2} \leq 6 \\
x_{1} \leq 10 \\
x_{2} \geq 1
\end{array}
$$

and

$$
x_{1}, x_{2} \geq 0
$$

Solution:

Adding slack variables $S_{1}, S_{2}$, surplus variable $S_{3}$ and artificial variable $A_{1}$ in the constraint set the LPP becomes;

$$
M a x Z=3 x_{1}+5 x_{2}+0 S_{1}+0 S_{2}+0 S_{3}-M A_{1}
$$

subject to the constraints

$$
\begin{gathered}
x_{1}-2 x_{2}+S_{1}=6 \\
x_{1}+S_{2}=10 \\
x_{2}-S_{3}+A_{1}=1
\end{gathered}
$$

and

$$
x_{1}, x_{2}, S_{1}, S_{2}, S_{3}, A_{1} \geq 0
$$

The initial solution to this LPP is shown in Table 1

Table 1: Initial Solution

|  |  | $C_{\mathrm{j}} \rightarrow$ | 3 | 5 | 0 | 0 | 0 | -M |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $C_{\mathrm{B}}$ | B | $b\left(=x_{\mathrm{B}}\right)$ | $x_{1}$ | $x_{2}$ | $S_{1}$ | $S_{2}$ | $S_{3}$ | $A_{1}$ | Min.Ratio |
| 0 | $S_{1}$ | 6 | 1 | -2 | 1 | 0 | 0 | 0 | - |
| 0 | $S_{2}$ | 10 | 1 | $\mathrm{O}_{0}$ | 0 | 1 | 0 | 0 | - |
| -M | $A_{1}$ | 1 | 0 | 1 | 0 | 0 | -1 | 1 | $1=1 \rightarrow$ |
| $Z=-M$ |  | $Z_{\mathrm{j}}$ | 0 | -M | 0 | 0 | M | -M |  |
|  |  | $C_{\mathrm{j}}-Z_{\mathrm{j}}$ | 3 | $5+\mathrm{M}$ | 0 | 0 | -M | 0 |  |

From Table $1, C_{2}-Z_{2}$ has largest positive value, thus variable $x_{2}$ enters the basis and $A_{1}$ leaves the basis. The new solution is shown in Table 2

Table 2: Improved Solution

|  |  | $C_{\mathrm{j}} \rightarrow \rightarrow$ | 3 | 5 | 0 | 0 | 0 | -M |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $C_{\mathrm{B}}$ | B | $b\left(=x_{\mathrm{B}}\right)$ | $x_{1}$ | $x_{2}$ | $S_{1}$ | $S_{2}$ | $S_{3}$ | $A_{1}$ |
| 0 | $S_{1}$ | 8 | 1 | 0 | 1 | 0 | -2 | 2 |
| 0 | $S_{2}$ | 10 | 1 | 0 | 0 | 1 | 0 | 0 |
| 5 | $x_{2}$ | 1 | 0 | 1 | 0 | 0 | -1 | 1 |
| $Z=5$ |  | $Z_{\mathrm{j}}$ | 0 | 5 | 0 | 0 | -5 | 5 |
|  |  | $C_{\mathrm{j}}-Z_{\mathrm{j}}$ | 3 | 0 | 0 | 0 | 5 | $-\mathrm{M}-5$ |

From the Table 2, $C_{1}-Z_{1}=3$ and $C_{5}-Z_{5}=5$ entries are positive and $C_{5}-Z_{5} \geq C_{1}-Z_{1}$. Therefore, variable $S_{3}$ should enter into the basis. Here it may be noted that coefficients in the ' $S_{3}$ ' column are all negative or zero. This indicates that $S_{3}$ cannot be entered into the basis. However, the value of $S_{3}$ can be increased infinitely without removing any one of the basic variables. Further, since $S_{3}$ is associated with $x_{1}$ in the third constraint, $x_{1}$ will also be increased infinitely because it can be expressed as $x_{1}=1+S_{3}-A_{1}$. Hence, the solution to the given LPP is unbounded.

## Infeasible Solution

In the final simplex table, if atleast one of the artificial variable appears with a positive value, no feasible solution exists, because it is not possible to remove such an artificial variable from the basis using the simplex algorithm. When an infeasible solution exists, the LP Model should be reformulated. This may be because of the fact that the model is either improperly formulated or two or more of the constraints are incompatible.

## Example:

$$
\operatorname{Max} Z=6 x_{1}+4 x_{2}
$$

subject to the constraints

$$
\begin{aligned}
x_{1}+x_{2} & \leq 5 \\
x_{2} & \geq 8
\end{aligned}
$$

and

$$
x_{1}, x_{2} \geq 0
$$

## Solution:

By adding slack, surplus and artificial variables, the LPP becomes;

$$
\operatorname{Max} Z=6 x_{1}+4 x_{2}+0 S_{1}+0 S_{2}-M A_{1}
$$

subject to the constraints

$$
\begin{aligned}
& x_{1}+x_{2}+S_{1}=5 \\
& x_{2}-S_{2}+A_{1}=8
\end{aligned}
$$

and

$$
x_{1}, x_{2}, S_{1}, S_{2}, A_{1} \geq 0
$$

The initial solution to this LPP is shown in Table 1

Table 1: Initial Solution

|  |  | $C_{\mathrm{j}} \rightarrow$ | 6 | 4 | 0 | 0 | -M |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $C_{\mathrm{B}}$ | B | $b\left(=x_{\mathrm{B}}\right)$ | $x_{1}-x_{2}$ | $S_{1}$ | $S_{2}$ | $A_{1}$ | Min.Ratio |  |
| 0 | $S_{1}$ | 5 | 1 | -1 | 1 | 0 | 0 | $1=5 \rightarrow$ |
| -M | $A_{1}$ | 8 | 0 | 1 | 0 | -1 | 1 | $1=8$ |
| $Z=-8 M$ |  | $Z_{\mathrm{j}}$ | 0 | -M | 0 | M | -M |  |
|  |  | $C_{\mathrm{j}}-Z_{\mathrm{j}}$ | 6 | $4+\mathrm{M}$ | 0 | -M | 0 |  |

Variable $x_{2}$ enters the basis and $S_{1}$ leaves the basis. The new solution is shown in Table 2

Table 2

|  |  | $C_{\mathrm{j}} \rightarrow$ | 6 | 4 | 0 | 0 | -M |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $C_{\mathrm{B}}$ | B | $b\left(=x_{\mathrm{B}}\right)$ | $x_{1}$ | $x_{2}$ | $S_{1}$ | $S_{2}$ | $A_{1}$ |
| 4 | $x_{2}$ | 5 | 1 | 1 | 1 | 0 | 0 |
| -M | $A_{1}$ | 3 | -1 | 0 | -1 | -1 | 1 |
| $Z=20-3 M$ |  | $Z_{\mathrm{j}}$ | $4+\mathrm{M}$ | 4 | $4+\mathrm{M}$ | M | -M |
|  |  | $C_{\mathrm{j}}-Z_{\mathrm{j}}$ | $2-\mathrm{M}$ | 0 | $-4-\mathrm{M}$ | -M | 0 |

Since all $C_{j}-Z_{j} \leq 0$, the solution shown in Table 4.28 is optimal. But this solution is not feasible for the given problem since it has $x_{1}=0$ and $x_{2}=5$ (recall that in the second constraint $x_{2} \geq 8$ ). The fact that artificial variable $A_{1}=3$ is in the solution also indicates that the final solution violates the second constraint.
